**The International Agency for Research on Cancer : Inorganic and Organic Lead Compounds (IARC Monographs on the Evaluation of the Carcinogenic Risks to Humans)** before purchasing it in order to gage whether or not it would be worth my time, and all praised Inorganic and Organic Lead Compounds (IARC Monographs on the Evaluation of the Carcinogenic Risks to Humans):

This monograph re-evaluates the potential carcinogenic hazards to humans from exposure to inorganic and organic lead compounds. Human exposure comes from lead-contaminated air, dust, soil, water and food and through inhalation and ingestion. Recent human exposure has arisen predominantly from the widespread use of leaded gasoline. Occupations in which the highest potential exposure to lead exists include mining primary and secondary smelting, production of lead-acid batteries, pigment production, construction and demolition. In spite of the persistence of lead in the environment, exposures have decreased substantially in countries where lead control measures have been implemented over the past 10-30 years.

About the Author The International Agency for Research on Cancer (IARC) is part of the World Health Organization. IARC's mission is to coordinate and conduct research on the causes of human cancer, the mechanisms of carcinogenesis, and to develop scientific strategies for cancer control. The Agency is involved in both epidemiological and laboratory research and disseminates scientific information through publications, meetings, courses, and fellowships.
