Series):

There is increasing recognition that advances in medicine are only part of the answer to better health care. These advances, together with rising expectations of health care users, mean that demands on the way we organise and deliver services will become greater. It is therefore essential that we advance our understanding and knowledge of how best to organise and deliver health services. This book, written by experienced teachers and researchers, introduces research methods from a wide range of social science disciplines and applies them to health service research. Each chapter takes a different research method or approach and provides: theoretical background; a description of the method; advice on how to use it; relevant examples; a discussion of the limitations of the method; a list of further reading. Research methods covered include: epidemiology; organisational psychology; action research; political science/policy analysis; organisational economics; historical methods and operational research. This book also looks at the issues in synthesising evidence from qualitative research and non-experimental quantitative studies. This is an invaluable reader for researchers, students and research funders and provides an appropriate text for the growing number of courses in the multidisciplinary field of health services research.

'Each chapter adopts a different discipline or approach to illuminate the theory, methodology and conclusions that will be helpful to all students and academics.' - Institute of Health Management.
'Managers whose bookshelves are creaking under the weight of research method texts may balk at the thought of yet another addition, yet I would urge them to find space for this slim volume.' - Health Service Journal
